Website ER #5 - Diagnosis Report

Tutorial 5: Designing for the Mobile Web

Name: _____Thanh Phan_____ Date: _____10/05/2026_____

For each of Webster's six responsive design problems, briefly identify what was wrong and explain how you repaired it. Your answers do not need to be long, but they should show that you understand what caused the problem and why your correction worked.

Injury #1

Problem Identified: In the main stylesheet, the display in the nav ul is set to block instead of flex which will cause the rest of the properties inside the nav ul will be ignored by browsers.

Repair Made: I change the display: block; to display: flex;.

Injury #2

Problem Identified: In the media query, the responsive breakpoint set min-width instead of max-width which will make the mobile layout overrides the desktop design on big screen and make screen that are smaller than 700px will be set to the default desktop rules.

Repair Made: I change the @media (min-width: 700px) to @media (max-width: 700px).

Injury #3

Problem Identified: In the media query, because .hero retains a two columns layout, which when the screen is narrow, text and other things can remain squeezed side by side instead of being on top of each other vertically.

Repair Made: I change the grid-template-columns: 1.05ft .95fr; to grid-template-columns: 1fr;.

Injury #4

Problem Identified: In the media query, .hero-art is set to a fix width of 760px on mobile viewports, which will forces the art image to extend beyond the screen width and can trigger horizontal scrollbars.

Repair Made: I remove the width: 760px; from .hero-art inside the media query.

Injury #5

Problem Identified: In the media query, the current set of .content-grid can cause the three cards be

forced into tight columns on mobile screens and make the text unreadable.

Repair Made: I change the grid-template-columns: repeat(3, 1fr); to grid-template-columns: 1fr; in the .content-grid.

Injury #6

Problem Identified: In the media query, the display of .trail-note is set to flex, which makes the secondary callouts take up space on a vertical screen.

Repair Made: I change the display: flex; to display: none;
